

Yorkshire Water

Embsay Water Treatment Works

When a Yorkshire Water WTW site experienced a significant rise in taste and odour complaints, Transvac were able to offer immediate assistance.

Thanks to a stock TransPAC unit, which was ready at Transvac Head Office in Derbyshire, the team were able to test, deliver and commission the complete carbon dosing solution in less than a week!

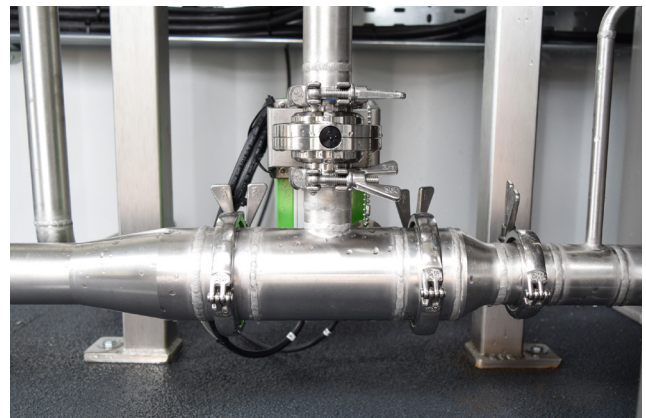

As the TransPAC is fully containerised, the whole unit was lifted via Hiab lorry and driven to the problem site on the same day. Transvac engineers then attended site to install and commission the TransPAC, setting the PAC dosing rates to the exact requirements of the site. With TransPAC, no PAC is wasted and the flow can be adjusted as conditions change.

The TransPAC was supplied with both a bulk bag dosing frame and silo feed chute as standard, allowing individual sites to choose their preferred method of transferring PAC into the hopper, either from bulk bags or a silo.

The client was pleased with the quick turnaround from Transvac - in fact, thanks to the stock unit, the whole timescale from order placement to delivery was just one week.

TransPAC during FAT testing at Transvac

Transvac PAC dosing Ejector

Client	Yorkshire Water
Issue	Taste & Odour Issue
Flowrate	3kg/hr – 60kg/hr
Product Provided	Fully containerised TransPAC system
Delivery Date	July 2017
